

Ethereum is a decentralized, open-source blockchain system that enables the creation and execution of smart contracts and decentralized applications (DApps). It was proposed by Vitalik Buterin in late 2013 and development began in early 2014, with the network going live on July 30, 2015. Ethereum's native cryptocurrency is called Ether (ETH), which is used to pay for transaction fees and computational services on the network.

Bitcoin is a decentralized digital currency that was created by an unknown person or group of people using the pseudonym Satoshi Nakamoto in 2009. It operates on a peer-to-peer network, with transactions verified by network nodes through cryptography and recorded on a public ledger called the blockchain. Bitcoin transactions are conducted directly between users without the need for intermediaries like banks, and they are confirmed within minutes by miners who solve complex mathematical puzzles. Bitcoin is often referred to as the first cryptocurrency because it paved the way for the development of thousands of other digital currencies. It is known for its limited supply, with a maximum cap of 21 million coins, making it a deflationary asset. Bitcoin's value is determined by supply and demand dynamics, as well as market speculation. Beyond its use as a digital currency, Bitcoin has also gained attention as a store of value and a hedge against inflation. It has been embraced by investors, traders, and institutions as a potential alternative to traditional fiat currencies and a diversification tool for investment portfolios.

Bitcoin was unveiled to the public in 2009 by an unidentified developer or group of developers under the pseudonym Satoshi Nakamoto.

Dogecoin, a decentralized cryptocurrency, emerged as a playful creation in December 2013, devised by software engineers Billy Markus and Jackson Palmer. With its logo and mascot depicting the Shiba Inu dog from the "Doge" meme, Dogecoin was initially conceived as a humorous venture. However, despite its origins, it has garnered a substantial following and community of enthusiasts. Functioning on a blockchain network akin to Bitcoin and Litecoin, Dogecoin employs a proof-of-work consensus mechanism. Geared towards speed, affordability, and user-friendliness, it has found popularity for tipping and facilitating small transactions.

Here is source code for authentication mechanism in Python:

```
from flask import Flask, request, render_template, redirect, session

app = Flask(__name__)
app.secret_key = 'administrator@123'

users = {'admin': 'password123', 'user1': 'password123'}

@app.route('/', methods=['GET', 'POST'])
def login():
    if request.method == 'POST':
        username = request.form['username']
        password = request.form['password']

        if username in users and users[username] == password:
            session['username'] = username
            return "Welcome back."
        else:
            return "Invalid username or password."

if __name__ == '__main__':
    app.run()
```
